

## ABSTRACT

The present invention relates to the method for manufacturing of comb-handle, more particularly to the method capable of manufacturing the comb-handle that its appearance is very beautiful because it has dual structure and the pattern including a logo is printed between two layers.

In the present invention that is manufactured by the method including the manufacturing procedure of the comb-handle core by injection molding; the forming procedure of the pattern on the surface of the comb-handle core; the diluting procedure after mixing a small amount of hardener and antifoam with Formica; the manufacturing procedure of the comb-handle that is hardened and dried after forming Formica layer to the outer face of the comb-handle core by fixing the comb-handle core to the inside of mold and by inputting the Formica dilute solution; the cutting processing procedure of the surface of the comb-handle; the glossy processing procedure of the surface of the comb-handle, the method for manufacturing of such a comb-handle that has an individuality and more high-grade beauty sense that is distinguished from the prior goods because even though the comb-handle is used for a long time, the pattern is not disappeared by forming the pattern between the comb-handle core and Formica layer and it has dual structure is provided.
